C. ITS DEGRADATION. THE CYTOSOLIC FORM ALSO INTERACTS WITH APC AND

C. E-CADAPHERIN. THE NUCLEER FORM BINDS TCFLEF-1 AND MAY ALSO BIND

C. PONTINS AND DUPLIN. CAN HETERODIMERIZE WITH ALPHA-CATENIN AND

C. PONTINS AND DUPLIN. CAN HETERODIMERIZE WITH ALCHA-CATENIN AND

C. STABLILLE CADHERIN COMPLEX TO THE CORTICAL ACTIN CATOSKELETON.

C. STABLILLED (LOW LEVEL. OF PHOSPHORYLATION).

C. PTM: PROBABLY PHOSPHORYLATION). TRANSLOCATES TO THE NUCLEUS WHEN IT IS

STABLILLED (LOW LEVEL. OF PHOSPHORYLATION).

C. PTM: PROBABLY PHOSPHORYLATION).

C. PTM: PROBABLY PHOSPHORYLATION OF GSK-3B. PHOSPHORYLATION OF BETA-

C. PTM: RESULTING IN ITS ACCUMULATION IN CYTOPLASM.

RESULTING IN ITS ACCUMULATION IN CYTOPLASM.

C. SIMILARITY: BELONGS TO THE BETA-CATENIN FAMILY.

C. SIMILARITY: CONTAINS 12 ARM REPEATS.

-!- FUNCTION: INVOLVED IN THE REGULATION OF CELL ADHESION AND IN SIGNAL TRANSDUCTION THROUGH THE WIT PATHWAX (BY SIMILARITY).

-!- SUBGINIT: THE CYTOSOLIC FORM BOUND TO AXIN ALLOWS THE STIMULATION OF ITS DEGRADATION. THE CYTOSOLIC FORM ALSO INTERACTS WITH APC AND B-CADHERIN. THE MUCLEAR FORM BINDS TCF/LEF-1 AND MAY ALSO BIND PONTINES AND DUPLIN. CAN HETERODIMERIZE WITH ALPHA-CATENIN AND ALSO FORM A TRIMBRIC COMPLEX WITH CADHERIN. MEDIATES THE ANCHORAGE OF THE CADHERIN COMPLEX WITH CADHERIN. MEDIATES THE ANCHORAGE OF THE CADHERIN COMPLEX TO THE CORTICAL ACTIN CYTOSKELETON (BY

TRANSLOCATES TO THE NUCLEUS WHEN IT IS TYBELLIZED (LOW LEVEL OF PHOSPHORYLATION) (BY SIMILARITY). TISSUE SPECIFICITY: EXPRESSED IN THE TESTIS.

DEVELOPMENTAL STAGE: HIGHLY EXPRESSED AT E30-60 DAY DPC IN THE TESTIS. REDUCED EXPRESSION AT E90 DAY DPC.
                                                                              Rattus norvegicus (Rat).

-!- FUNCTION: COMMON JUNCTIONAL PLAQUE PROTEIN. THE MEMBRANE-
ASSOCIATED PLAQUES ARE ARCHITECTURAL ELEMENTS IN AN IMPORTANT
STRATEGIC POSITION TO INFLUENCE THE ARRANGEMENT AND FUNCTION
OF BOTH THE CYTOSRELETON AND THE CELLS WITHIN THE TISSUE. THE
PRESENCE OF PLAKOSLOBIN IN BOTH THE DESMOSOMES AND IN THE
INTERMEDIATE JUNCTIONS SUGGESTS THAT IT PLAYS A CENTRAL ROLE IN
THE STRUCTURE AND FUNCTION OF SUBMEMBRANOUS PLAQUES.

ASSOCIATED PLAQUES ARE ARCHITECTURAL ELEMENTS IN AN IMPORTANT
STRATEGIC POSITION TO INFLUENCE THE ARRANGEMENT AND FUNCTION
OF BOTH THE CYTCKELETON AND THE CELLS WITHIN THE TISSUE. THE
PRESENCE OF PLAKOGLOBIN IN BOTH THE DESWOSOMES AND IN THE
INTERMEDIATE JUNCTIONS SUGGESTS THAT IT PLAYS A CENTRAL ROLE IN
THE STRUCTURE AND FUNCTION OF SUBMEMBRANOUS PLAQUES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Metazoa; 'Chordata; Craniata; Vertebrata; Euteleostomi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                -!- FUNCTION: BINDS SPECIFICALLY AND DIRECTLY TO SUBSTRATES CONTAINING EITHER A SIMPLE OR BIPARTITE NLS MOTIF. PROMOTES DOCKING OF IMPORT SUBSTRATES TO THE NUCLEAR ENVELOPE. SEEMS TO ACT AS A CYTOSOLIC. RECEPTOR FOR BOTH SIMPLE AND BIPARTITE NLS MOTIFS (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SUBUNIT: FORMS A COMPLEX WITH IMPORTIN BETA SUBUNIT.
SUBCELLULAR LOCATION: SHUTTLES BETWEEN THE CYTOPLASMIC AND NUCLEUS
IN A CELL CYCLE-DEPENDENT MANNER.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HALF OF EMBRYOGENESIS REACHING A MAXIMUM BETWEEN. 4 AND 8 HRS OF DEVELOPMENT. PROTEIN EXPRESSION INVERASES AGAIN FROM THE THIRD LARVAL INSTAR ONWARDS. IT IS EXPRESSED IN A MATERNAL/EARLY EMBRYOUIC PHASE, AND AGAIN DURING MORPHOGENESIS IN LATE LARVAL AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -i. TISSUE SPECIFICITY: PREDOMINANTLY EXPRESSED IN THE NEUROBLAST STEM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SERVE AS AN ADAPTER MOLECULE TO FORM COMPLEXES WITH OTHER PROTEINS. MAY ACT AS A TUNOR SUPPRESSOR IN HEMATOPOLETIC CELLS. MAY PLAY A ROLE IN THE NUCLEAR IMPORT OF KARYOPHILIC PROTEINS AND SOME OF THESE MAY BE REQUIRED FOR THE NORMAL TRANSMISSION AND FUNCTION OF PROLIFERATIVE SIGNALS IN THE CELLS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DEVELOPMENTAL STAGE: HIGH LEVELS ARE DETECTED DURING THE FIRST
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PUPAL STAGES.
--- SIMILARITY: BELONGS TO THE IMPORTIN ALPHA FAMILY.
--- SIMILARITY: CONTAINS 10 ARM REPEATS.

-I DISEASE: NEUROFIEROMATOSIS 2 (NF2) OR CENTRAL NEUROFIEROMATOSIS IS
A GENETIC DISORDER CHRARCTERIZED BY BILATERAL VESTIBULAR
SCHWANNOMAS (FORMERLY CALLED ACOUSTIC NEUROMAS), SCHWANNOMAS OF
OTHER CRANTAL AND PERPHERAL NERVES, MENINGTOMAS, AND EPENDYMONAS.
IT IS INHERITED IN AN AUTOSOMAL DOMINANT FASHION WITH FULL
PENETRANCE. AFFECTED INDIVIDUALLS GENERALLY DEVELOP SYMPTOMS OF
EIGHTH-NERVE DYSEUDOTION IN EARLY ADULTHOOD, INCLUDING DEFENESS
AND BALANCE DISORDER. ALTHOUGH THE TUMORS OF NF2 ARE
HISTOLOGICALLY BENIGAN, THEIR ANATOMIC LOCATION MAKES MANAGEMENT
DIFFICULT, AND PATIENTS SUFFER GREAT MORBIDITY AND MORTALITY.
                                                                                                                                                                                                        This SWISS-PROT entry is copyright. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This invention describes a novel agent (A) for treating human disease which is based on substances (I) that modulate (inhibit or promote) the interaction of beth catenin with transcription factors or products of tumor suppressor genes, The invention also describes (a) peptides (II) comprising part of the invention also describes (a) peptides (II) comprising part of the invention and related molecules (III) from the armadillo domain (arm units) (b) peptides and related molecules (III) from the complete beta-catenin molecule, that include at least one of the specific interaction domains for LBF-1, TCF-4, APC, conductin or complete beta-catenin molecule, that include at least one of the specific interaction domains for LBF-1, TCF-4, APC, conductin or screening substance linked immunosorbent assay (ELISA) for correction with LEF-1/TCF, APC, conductin or E-cadherin. Beta-catenin is a key compound in the wint signalling pathway and is involved in development of funors. Generally its interaction with LEF-1 or TCF-4 is oncogenic. (A) which inhibit interaction are particularly used to treat tumors, especially carcinome of the colon and melanome, but also, where they promote interaction, to stimulate regeneration of organs and tissues, specifically mair growth. AAY33230-Y33241 represent mutant the method of the colon in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match 100.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        QΥ
which is based on substances (I) that modulate (inhibit or promote) the which is based on substances (I) that modulate (inhibit or promote) the interaction of beta-catenin with transcription factors or products of tumor suppressor genes. The invention also describes (a) peptides (I) comprising part of the LEF-1/TCF-4 transcription factors, or their variants and mutants; (b) peptides and related molecules (III) from the complete beta-catenin molecule, that include at least one of the complete beta-catenin molecule, that include at least one of the specific interaction domains for LEF-1, TCF-4, APC, conductin or Screening substance libraries for compounds that modulate interaction of beta-catenin with LEF-1/TCF, APC, conductin or E-cadherin. Beta-catenin is the Wint signalling pathway and is involved in development of tumors. Generally its interaction with LEF-1 or TCF-4 is oncogenic but interaction with APC, conductin or E-cadherin is oncogenic. (A) which inhibit interaction mare particularly used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Beta-catenin; human; armadillo repeat; treatment; human disease; LEF-1; modulator; interaction domain; transcription factor; TCF-4; oncogenic; tumor suppressor gene; conductin; B-cadharin; screening; carcinoma; APC; Wnt signalling pathway; tumor development; anti-oncogenic; melanoma; organ regeneration; tissue regeneration; hair growth; mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          treat tumors, especially carcinoma of the colon and melanoma, but also, where they promote interaction, to stimulate regeneration of organs and tissues, specifically hair growth. AAY32217 '733222 represent human beta-catenin armadillo repeat fragments described in the method of the

Wnt polypeptides are useful for promotive maturation of an immature occyte. Wnt polypeptides are also useful for increasing the number of mature occytes and to enhance occyte viability. Soluble fragments of Wnt polypeptides have the ability to inhibit Wnt signalling, eg., by blocking binding of a naturally-occurring Wnt protein to its receptor. They may be used to generate monoclonal antibodies which can inhibit occyte development. The present sequence is the human beta-catenin protein. Dominant negative mutants of beta-catenin lack one
                                                   Beta catenin is a member of the catenin family of cytosolic proteins and a key member of the Mat signalling pathway. Catenins interact with the cytoplasmic domains of cadherin glycoproteins, and are important in maintaining cell adhesiveness. The loss of cell adhesiveness is implicated in metastasis. Beta catenin is also known as cadherin-associated protein and is implicated in colorectal cancer and melanoma. The present sequence is the human beta catenin protein. The coding sequence of this protein was used in the present invention to design antisense oligonuclectides (AAA58327-A58366). The oligonuclectides are capable of hybridising to human beta catenin, in order to inhibit expression of human beta catenin. The oligonuclectides may be used in gene therapy for colorectal cancer or melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Contraceptive composition for inhibiting oocyte development in a female primate comprises a Wnt polypeptide antagonist

coring and for regeneration of bone, cartilage, tendon, ligament and/or nerve and for regeneration of bone, cartilage, tendon, ligament and/or nerve clasue growth, and in tissue repair, healing of burns, incisions, clasue growth, and in tissue repair, healing of burns, incisions, clasue growth, and in tissue repair, healing of burns, incisions, clasue growth, and in tissue repair, healing of burns, incisions, clasue growth, and in tissue repair, healing of burns, incisions, conference of gisorders, or periodontal disease. Furthermore, (I) is also useful for cut protection or regeneration and treatment of lung or liver fibrosis, creperfusion injury in various tissues, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or cupantial infections, autofinmune disorders e.g. multiple sclerosis, crhematoid arthritis, diabetes mellitus, myasthenia gravis, altergic reactions and conditions, such as asthma or other respiratory problems. Cf ertility, metabolism, catabolism, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, provides catuvity and can act as an antigen in a vaccine composition to raise an entigen metaponer in the composition to raise an entigen and composition to raise and the composition are created protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
the polypeptide as well as for studying modulators of the polypeptides.

(I) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, Parkinson's disease, Huntington's disease, and amyotrophic lateral sclerosis. In addition, (I) is involved in chemotactic or chemokinetic activity, regulation of haematopoiesis and is useful for treating myeloid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          In vitro expansion of mammalian stem or progenitor cells, useful for producing cells that retain their pluripotential phenotype after expansion for use in transplantation, involves increasing the levels of beta-catenin in the cell -

mammalian stem, or progenitor cells, which comprising increasing the mammalian stem, or progenitor cells, which comprising increasing the increasing the increasing the increasing the concentration of beta-catenin in a progenitor or stem cell in an invitor outlive medium for a period sufficient for the progenitor or stem cell to divide. The number of cells having the functional sphenotype of the stem or progenitor cells is expanded. The method is useful for culturing stem cells and progenitor cells, which retain their pluripotential phenotype after expansion, in vitro. The expanded cell populations are useful as a source of stem cells, e.g. to reconstitute function in a host that is deficient in a particular cell lineage or lineages. The expanded cell populations are also useful in transplantation to restore haematopoletic function to autologous or alloquence recipients. The present sequence is human beta catenin protein. Beta-catenin is a pivotal player in the signalling pathway intilated by Wnt proteins, which are mediators of several developmental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a method for in vitro expansion of mammalian stem or progenitor cells, which comprising increasing the intracellular concentration of beta-catenin in a progenitor or stem cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    of

```
in an in vitro culture medium for a period sufficient for the progenitor or stem cell to divide. The number of cells having the functional phenotype of the stem or progenitor cells is expanded. The method is useful for culturing stem cells and progenitor cells, which retain their puluripotential phenotype after expansion, in vitro. The expanded cell populations are useful as a source of stem cells, e.g. to reconstitute function in a host that is deficient in a particular cell lineage or lineages. The expanded cell populations are also useful in transplantation to restore haematopoietic function to autologous or allogeneic recipients. The present sequence is mouse beta-catenin protein. Beta-catenin is a pivotal player in the signalling pathway initiated by Wnt proteins, which are mediators of several developmental
                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 781 AA;
                                                                                                                                                                                                                                                                                                                                                                            processes.

and polynucleotides (II). (I) and (III) are useful for treating inflammatory conditions such as arthritis, nephritis, Crohn's disease, ischaemia-reperfusion injury, shock, sepsis, immune responses, and is involved in increasing hematopolesis, stem cell survival, bone growth and, remodeling (I), (II) and modulators of (II) are useful for reacting transgenic animals useful for studying the in vivo activities of creating transgenic animals useful for studying the in vivo activities of the polypeptides.

(I) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and can brain tissue and is useful for the treatment of central and can brain stayled diseases and neuropathies, such as Alzheimer's, Parkinson's disease, Huntington's disease, and amyotrophic lateral cativity, regulation of haematopolesis and is useful for treating myeloid or lymphoid cell disorders, platelet disorders such as thrombocytopenia and for regeneration of bone, cartillage, tendon, ligament and/or nerve of the contral and of bone, cartillage, tendon, ligament and/or nerve of the contral and of bone, cartillage, tendon, ligament and/or nerve of the contral and of bone, cartillage, tendon, ligament and/or nerve of the contral and of bone, cartillage, tendon, ligament and/or nerve of the contral and of bone, cartillage, tendon, ligament and/or nerve of the contral contral that and in these repair, healing of burns, incisions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ulcers, for treating osteoporosis, osteoarthritis, bone degenerative disorders, for treating osteoporosis, osteoarthritis, bone degenerative disorders, or periodontal disease. Furthermore, (I) is also useful for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis, rheumatoid arthritis, diabetes mellitus, myasthenia gravis, allergic reactions and conditions, such as asthma or other respiratory problems. In addition, (I) affects biorhythms or circadian cycles of rhythms, fertility, metabolism, catabolism, anabolism, storage or elimination of distary fat, lipid, protein, carbohydrate, vitamins, minerals, provides analgesic effects or other pain reducing effects, immunosibulum like activity and can act as an antigen in a vaccine composition to raise an immune response. AAU28020-AAU28035 represent novel human secreted protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

(ABB57137-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1000 or more and cell-cell
                                                                               solated nucleic acid detection reagent for detecting 1000 or more from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequences (ABLO1840-ABL16175) and the encoded proteins (ABB37737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                         sequences (ABL01840-ABL16175) and the encoded proteins (ARB7377-ABR2072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at frp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell. interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLI6176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins

                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell.cell interactions in higher eukaryotes for the development of insecticidaes, therapeutics and pharmaceutical frugs. The invention discloses genomic DNA sequences (ABLiG176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                            (ABBS7737-ABB72072). This patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 5

The present sequence is a polypeptide comprising a 3023 amino acid sequence which is encoded by a cDNA (AAT13279) to a hepatitis C virus (HCV) genomic RNA The protein can be easily detected by antibodies in an assay for the detection of HCV. The DNA and the protein are useful for classifying the subtype of HCV. At least a part of the protein may be used as a vaccine against HCV.
                                                                                                                                                                                                                                                                                                                                               Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SIMILARITY)

-1- SUBCELLULAR LOCATION: CYTOPLASMIC WHEN IT IS UNSTABILIZED (HIGH
LEVEL OF PHOSPHORYLATION). TRANSLOCATES TO THE NUCLEUS WHEN IT IS
STABILIZED (LOW LEVEL OF PHOSPHORYLATION) (BY SIMILARITY).

-1- TISSUE SPECIFICITY: EXPRESSED IN THE TESTIS.

-1- DEVELOPMENTAL STAGE: HIGHLY EXPRESSED AT E30-60 DAY DPC IN THE
TESTIS. REDUCED EXPRESSION AT E90 DAY DPC.

-1- PTM: PROBABLY PHOSPHORYLATED BY GSK-3B. WNT-DEPENDENT ACTIVATION
OF DVL ANTAGONIZES THE ACTION OF GSK-3B. PHOSPHORYLATION OF BETA-
CATENIN IS REDUCED AND THE PROTEIN IS NO LONGER DEGRADED,
RESULTING IN ITS ACCUMULATION IN CYTOPLASM (BY SIMILARITY).

-1- SIMILARITY: ODNTAINS 12 ARM REPEATS.
                                                                                                                                                                                                                                                                       FUNCTION: INVOLVED IN THE REGULATION OF CELL ADHESION AND IN SIGNAL TRANSDUCTION THROUGH THE WAT PATHAXY (BY SIMILARITY).
SIGNAL TRANSDUCTION THROUGH THE WIT ALLOWS THE STIMULATION OF ITS DEGRADATION. THE CYTOSOLIC FORM ALSO INTERRACTS WITH APC AND E-CADHERIN. THE NUCLEAR FORM BINDS TCF/LEF-1 AND MAY ALSO BIND PONTINS AND DUPLIN. CAN HETERODIMERIZE WITH ALPHA-CATENIN AND ALSO FORM A TRIMERIC COMPLEX WITH CADHERIN. MEDIATES THE ANCHORAGE OF THE CADHERIN COMPLEX TO THE CORTICAL ACTION (BY

SGG IS REQUIRED FOR PHOSPHORYLATION AND WG SIGNAL NEGATIVELY REGULATES ARM PHOSPHORYLATION.
HYPOPHOSPHORYLATED FORM OF ARM INCREASES IN STEADY-STATE LEVELS.
SIMILARITY: BELONGS TO THE BETA-CATENIN FAMILY.
SIMILARITY: CONTAINS 12.5 ARM REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   INTERSEGEMNTAL NEAVES.

1. ACCOMULATE IN THE PNS.

1. DECUDIDATE IN THE STATE TO MID-EMBRYOGENESIS.

1. PHOSPHORYLATED ON SER, THR AND TYR RESIDUES. LEVEL OF PHM: PHOSPHORYLATED ON SER, THR AND TYR RESIDUES. LEVEL OF PHOSPHORYLATION VARIES BOTH DURING EMBRYONIC DEVELOPMENT AN PHOSPHORYLATION.
                                                                                                                                                                                                                                                                                                             "From sequence to chromosome: the tip of the X chromosome of D.
   s:
Zhong F.N., Zhong W., Zhou X., Zhu S., Myers E.W., Rubin G.M., Venter J.C.; sequence of Drosophila melanogaster.";
                                                                                    SEGUENCE FROM N.A. (CYTOPLASMIC ISOFORM).

Biol. 153:337-346(1992).

-1- FUNCTION: COMMON JUNCTIONAL PLAQUE PROFEIN. THE MEMBRANE-ASSOCIATED PLAQUES ARE ARCHITECTURAL ELEMENTS IN AN IMPORTANT STRATEGIC POSITION TO INFLUENCE THE ARRANGEMENT AND FUNCTION OF BOTH THE CYTOSKELETON AND THE CELLS WITHIN THE TISSUE. THE PRESENCE OF BLAKOGLOBIN IN 1N BOTH THE DESMOSOMES AND IN THE INTERNEDIATE JUNCTIONS SUGGESTS THAT IT PLAYS A CENTRAL ROLE IN THE STRUCTURE AND FUNCTION OF SUBMEMBRANOUS PLAQUES.

STRATEGIC POSITION TO INFLUENCE THE ARRANGEMENT AND FUNCTION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      OF BOTH THE CYTOSKELETON AND THE CELLS WITHIN THE TISSUE. THE PRESENCE OF PARKOGLOBIN IN BOTH THE DESMOSOMES AND IN THE INTERMEDIATE JUNCTIONS SUGGESTS THAT IT PLAYS A CENTRAL ROLE IN THE STRUCTURE AND FUNCTION OF SUBMEMBRANOUS PLAQUES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Homo sapiens (Human).

The similarity: Belongs to the beta-catenin family.

Similarity: Contains 10 arm repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 128; DB 1; L

Agents for treating human diseases, particularly cancer, modulate interaction of beta-catenin with transcription factors or tumor

.

```
This invention describes a novel agent (A) for treating human disease which is based on substances (I) that modulate (inhibit or promote) the interaction of beta-catenin with transcription factors or products of tumor suppressor genes. The invention also describes (a) peptides (II) comprising part of the LEF-1/TCF-4 transcription factors, or their variants and mutants; (b) peptides and related molecules (III) from the complete beta-catenin molecule, that include at least one of the specific interaction domains for LEF-1, TCF-4, APC, conductin or specific interaction of mimunosorbent assay (ELISA) for screening substance libraries for compounds that modulate interaction of beta-catenin with LEF-1/TCF, APC, conductin or E-cadherin. Beta-catenin (E) as key compound in the Wht signalling pathway and is involved in development of tumors. Generally its interaction with LEF-1 or TCF-4 is oncogenic but interaction with APC, conductin or E-cadherin is concepting the interaction and melanoma, but also, treat tumors, especially carcinoma of the colon and melanoma, but also, the catenin armadillo repeat fragments described in the method of the

 The patent discloses a method of female primate contraception comprising administering an antagonist of a Wnt polypeptide, inhibiting oocyte development. Wnt polypeptides are useful for promotive meturation of an immature occyte. Wnt polypeptides are also useful for increasing the number of mature occytes and to enhance occyte viability. Soluble fragments of Wnt polypeptides have the ability to inhibit Wnt signalling, e.g., by blocking binding of a naturally-occurring Wnt protein to its receptor. They may be used to generate monoclonal antibodies which can inhibit occyte development. The present sequence is the human beta-catenin protein. Dominant negative mutants of beta-catenin lack one
 Human, beta-catenin; Wht antagonist; contraceptive; contraceptive vaccine; oocyte development; female primate contraception; oocyte viability; monoclonal antibody; Wht signalling.
 Retarget catenin is a member of the catenin family of cytosolic proteins and a key member of the Wnt signalling pathway. Catenins interact with the cytoplasmic domains of cadherin glycoproteins, and are important in maintaining cell adhesiveness. The loss of cell adhesiveness is implicated in metastasis. Bete catenin is also known as cacherin-associated protein and is implicated in colorectal cancer and melanoma. The present sequence is the human beta catenin protein. The coding sequence of this protein was used in the present invention to design antisense oligonucleotides (AAA58127-A58366). The oligonucleotides are capable of hybridising to human beta catenin, in order to inhibit expression of human beta catenin. The oligonucleotides may be used in gene: therapy for colorectal cancer or melanoma.

The present invention relates to a method for in vitro expansion of mammalian stem or progenitor cells, which comprising increasing the intracellular concentration of beta-catenin in a progenitor or stem cell in an in vitro culture medium for a period sufficient for the progenitor or stem cell to divide. The number of cells having the functional phenotype of the stem or progenitor cells having the functional useful for culturing stem cells and progenitor cells, which retain their pluripotential phenotype after expansion, in vitro. The expanded cell populations are useful as a source of stem cells, e.g. to reconstitute function in a host that is deficient in a particular cell lineage or the contraction is a source of stem cells. transplantation to restore haematopoietic function to autologous or allogeneic recipients. The present sequence is human betta-catenin protein. Beta-catenin is a pivotal player in the signalling pathway initiated by Wnt proteins, which are mediators of several developmental

In vitro expansion of mammalian stem or progenitor cells, useful for producing cells that retain their pluripotential phenotype after expansion for use in transplantation, involves increasing the levels of beta-catenin in the cell

Disclosure; Page 28-30; 33pp; English.

The present invention relates to a method for in vitro expansion of mammalian stem or progenitor cells, which comprising increasing the intracellular concentration of beta-catenin in a progenitor or stem cell

```
or stem cell to divide. The number of cells having the functional phenotype of the stem or progenitor cells is expanded. The method is useful for culturing stem cells and progenitor cells, which retain their pluripotential; phenotype after expansion, in vitro. The expanded cell
in an in vitro culture medium for a period sufficient for the progenitor
 populations are useful as a source of stem cells, e.g. to reconstitute function in a host that is deficient in a particular cell lineage or lineages. The expanded cell populations are also useful in transplantation to restore haematopoietic function to autologous or allogement recipients. The present sequence is mouse beta-catenin protein, Beta-catenin is a privotal player in the signalling pathway initiated by Wnt proteins, which are mediators of several developmental

Agents for treating human diseases, particularly cancer, modula interaction of beta-catenin with transcription factors or tumor Agents for treating human diseases, suppressor gene products

Example 4; Fig 5; 16pp; German.

This invention describes a novel agent (A) for treating human disease which is based on substances (I) that modulate (inhibit or promote) the interaction of beta-catenin with transcription factors or products of tumor suppressor genes. The invention also describes (a) peptides (II) comprising part of the LEF-1/TCF-4 transcription factors, or their variants and mutants; (b) peptides and related molecules (III) from the armadillo domain (arm units 3-8) of beta-catenin, and mutants of the compliste beta-catenin molecule, that include at least one of the

 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences senomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
 E-cadherin; and (c) enzyme-linked immunosorbent assay (ELISA) for screening substance libraries for compounds that modulate interaction of beta-catenin with LEF-1/TCF, APC, conductin or E-cadherin. Beta-catenin is a key compound in the Wht signalling pathway and is involved in development of tumors. Generally its interaction with LEF-1 or TCF-4 is oncogenic but interaction with APC, conductin or E-cadherin is anti-oncogenic. (A) which inhibit interaction are particularly used to treat tumors, especially carcinoma of the colon and melanoma, but also, where they promote interaction, to stimulate regeneration of organs and tissues, specifically hair growth. AAV33230-Y33241 represent mutant human beta-catenin armadillo repeat fragments described in the method of

 AAPISS66 to AAFI6505 encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. Nucleic acids encoding Plakophilin-3 polypeptides, useful for treating skin diseases and disorders of epithelial tissue associated with inappropriate Plakophilin-3 expression and activity -

Example 1; Fig 2; 132pp; English.

The present invention describes an isolated or recombinant nucleic acid molecule (I) encoding a Plakophilin-3 (PRF9), from humans, mice and Xenopus laevis. (I) has dermatological activity, and can be used in can be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRP9 expression, such as skin diseases and disorders affecting epithelial tissue. For example, (I) (and vectors containing first decreased PRP3 polypeptide may be used to treat disorders associated with decreased PRP3 expression by rectifying mutations or deletions in a patient's genome that affect the activity of PRP3 by expression a patient's genome that affect the activity of PRP3 by expressing inactive proteins or to supplement the patients own production of PRP3 polypeptides. Additionally, (I) may be used to produce PRP3, according to standard recombinant DNA methodology, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence which patients may be in need of restorative therapy. The PRP3 putypeptides may be in need of restorative therapy. The PRP3 putypeptides may be used as antigens in the anti-PRP3 antibodies and PRP3 antagonists may also be used as diagnostic and matagonists of PRP3 antagonists may also be used as diagnostic and matagonists of PRP3 antagonists may also be used as diagnostic and matagonists of perturb prevent assays (ELISA)). PRP3 is a catenin-like protein, which is present in desmosomes and wone and when the present sequence represents human are actived by the present sequence represents human and pages and pages and prevent sequence represents human and pages and pag PKP3, as given in the present invention.

A MEDILIALIAN PRODUCED AS A MEDILIAL PROPERTY AND A MEDILIAL PROPERTY A MEDILIAL PROPERTY AND A MEDILIAL PRANSMISSION OF DEVELOPMENTAL INFORMATION. CAN ASSOCIATE WITH ALPHA-CATENIN. CYTOPLASMIC ISOFORM ACCUMULATES THROUGH WG SIGNALING. ARM FUNCTION IN WG SIGNAL TRANSMISSION OF DEVELOPMENTAL INFORMATION. CAN ASSOCIATE WITH ALPHA-CATENIN. CYTOPLASMIC ISOFORM ACCUMULATES THROUGH WG SIGNALING. ARM FUNCTION OF DETERMINATION OF NEUROBLAST FATE. ARM AND ABL PROTEINS FUNCTION COOPERATIVELY AT ADHERENS JUNCTIONS IN BOTH THE CNS AND PEDIBERMIS.

1- SUBCELLULAR LOCATION: CYTOPLASMIC AND MEMBRANE-ASSOCIATED WITH THE COOPERATIVELY STOPLASMIC (SHOWN HERE) AND NEURAL; ARE PRODUCTS: 2 ISOFORMS; CYTOPLASMIC (SHOWN HERE) AND NEURAL; ARE PRODUCED BY ALTERNATIVE SPLICING.

1- TISSUE SPECIFICITY: CYTOPLASMIC ISOFORM IS PREDOMINANT BEFORE GERM DANN DEFINING AND PRIBLY AND DEFINING AND DEFINING AND PRIBLY AND DEFINING AND PRIBLY AND DEFINING
 BAND RETRACTION, AFTER RETRACTION AND DUBING LARVAL STAGES, IT IS FOUND IN HIGH LEVELS IN SPECIFIC CELLS ALONG THE CNS MIDLINE.

ROUND IN HIGH LEVELS IN SPECIFIC CELLS ALONG THE CNS MIDLINE.

ROUND IN HIGH LEVELS IN SPECIFIC CELLS ALONG THE CNS MIDLINE.

AXON TRACTS OF THE CNS, ALSO PRESENT IN AXONS DURING LARVAL STAGES AND ACCUMULATES IN THE MOTOR NEURONS OF THE SECHMENTAL AND INTERSEGEMENTAL AND INTERSEGEMENTAL AND ACCUMULATE IN THE POPS.

INTERSECEMENTAL NERVES AS THEY EXIT THE CNS. BOTH ISOFORMS ACCUMULATE IN THE POPS.

-!- DEVELOPMENTAL STAGE: PRESENT AT ALL STAGES, BUT REACHED THE HIGHEST LEVELS DURING EARLY TO MID-EMBRYOGENESIS.

-!- PIM: PROSPHORYLATED ON SER, THR AND TYR RESIDIDES. LEVEL OF PHOSPHORYLATION VARIES BOTH DURING EMBRYONIC DEVELOPMENT AND FROM EMBRYONIC TISSUE TO TISSUE. SGG IS REQUIRED FOR PHOSPHORYLATION AND WG SIGNAL NEGATIVELY REGILATES ARM PHOSPHORYLATION AND WG SIGNAL NEGATIVELY REGILATES ARM PHOSPHORYLATION HYPOPHOSPHORYLATID FORM OF ARM INCREASES IN STEADY-STATE LEVELS.

-!- SIMILARITY: CONTAINS 12.5 ARM REPEATS.

 The patent discloses a method of female primate contraception comprising administering an antaqonist of a Wnt polypeptide, inhibiting occyte development. Wnt polypeptides are useful for promotive maturation of an immature occyte. Wnt polypeptides are also useful for increasing the number of mature occytes and to enhance occyte viability. Soluble fragments of Wnt polypeptides have the ability to inhibit Wnt signalling, e.g., by blocking binding of a naturally-occurring Wnt protein to its receptor. They may be used to generate monoclonal antibodies which can inhibit occyte development. The present sequence is the human
 Human beta-catenin; Wnt antagonist; contraceptive; contraceptive vaccine; oocyte development; female primate contraception; oocyte viability; monoclonal antibody; Wnt signalling.
 Beta catenin is a member of the catenin family of cytosolic proteins and a key member of the Mnt signalling pathway. Catenins interact with the cytoplasmic domains of cadherin glycoproteins, and are important in maintaining cell adhesiveness. The loss of cell adhesiveness is implicated in metastasis. Beta catenin is also known as cadherin-associated protein and is implicated in colorectal cancer and melanoma. The present sequence is the human beta catenin protein. The coding sequence of this protein was used in the present invention to design antisense oligonucleotides (AAA58327-A588366). The oligonucleotides are capable of human beta catenin. The order to inhibit expression of human beta catenin. The order to inhibit expression of human beta catenin. The oligonucleotides may be used in gene therapy for colorectal cancer or melanoma.
 Contraceptive composition for inhibiting oocyte development in a female primate comprises a Wnt polypeptide antagonist

beta-catenin in the cell -

The property of the treatment of central and practices of the property of central and praintissue and its useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, Parkinson's disease, in admyortrophic lateral celerosis. In addition, (I) is involved in chemotactic or chemokinetic activity, regulation of haematopoiesis and is useful for treating myeloid cor lymphoid cell disorders, platelet disorders such as thrombooytopenia and for regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, and in tissue repair, healing of burns, incisions, ulcers, for treating osteoporoxis, osteobarthritis, bone degenerative disorders, or periodontal disease. Furthermore, (I) is also useful for gut protection or regeneration and treatment of lung or liver fibrosis, ceperfusion injury in various tissues, various immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis, creactions and conditions, such as asthma or other respiratory problems. Creactions and conditions, such as asthma or other respiratory problems. Creactions and conditions, such as asthma or other respiratory problems. Creactions fatt, lipid, protein, carbohydrate, vitamins, minerals, provides analgesic effects or other pain reducing effects, immunoglobulin like activity and can act as an antigen in a vaccine composition to raise an immune each protein amino acid sequences of the invention. creating transgenic animals useful for studying the in vivo activities of the polypeptide as well as for studying modulators of the polypeptides. (I) induces the proliferation of neural cells and regeneration of neural and brain tissue and is useful for the treatment of central and amino acid sequences of the invention. 781 AA; Sequence

 This invention describes a novel agent (A) for treating human disease which is based on substances (I) that modulate (inhibit or promote) the interaction of beta-catenin with transcription factors or products of interaction of beta-catenin with transcription factors or products of tumor suppressor genes. The invention also describes (a) peptides (II) comprising part of the LEF-1/TCF4 transcription factors, or their comprising part of the LeF-1/TCF4 transcription factors, or their armadillo domain (arm units 3-8) of beta-catenin, and mutants of the complete beta-catenin molecule, that include at least one of the complete beta-catenin molecule, that include at least one of the specific interaction domains for LEF-1, TCF-4, APC, conductin or specific interaction domains for LEF-1, TCF-4, APC, conductin or screening substance libraries for compounds that modulate interaction of beta-catenin with LEF-1/TCF, APC, conductin or E-cadherin. Beta-catenin component of tumors. Generally its interaction with LEF-1/TCF, APC, conductin or E-cadherin is a key compound in the Wnt signalling pathway and is involved in development of tumors. Generally its interaction are particularly used to concogenic but interaction with APC, conductin or E-cadherin is anti-oncogenic. (A) which inhibit interaction are particularly used to create they promote interaction, to stimulate regeneration of organs and tissues, specifically mair growth. AAY33230.Y33341 represent mutant the house in the method of the signal of the colon and melanoma.

New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -

Disclosure; SEQ ID NO 24255; 21pp + Sequence Listing; English

isThe invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins sequences (ABL01840 (ABB57737-ABB72072)

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences.

Ruben SM; Rosen, CA, WPI: 2000-587513/55 N-FSDB; AAF16013 Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as prostate cancer

Claim'11; Page 1813-1815; 2338pp; English.

AAFI5566 to AAF16505 encode the human prostate cancer associated profeins, called prostate cancer antigens, given in AAB55363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardiactive; immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaacological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat discretes such as neural, immune, muscular, reproductive discretinal, pulmonary, cardiovascular, renal, and proliferative discretes; wounds, and infectious diseases. AAF16506 to AAF16514 to invention.

Recombinant tumour PEX protein; phosphate regulating gene; inhibition; endopeptidases; metalloendopeptidase; tumour; OHO; PEX active site; oncogenous hypophosphataemia osteomalacia; chronic renal failure;
 This is the amino acid sequence of the recombinant human tumour PEX protein a product of a phosphate regulating gene with homology to endopeptidases, suggesting that PEX might be a metalloendospetidase. It was isolated from tumours causing oncogenous hypophosphataemia osteomalacia (OHO). Compounds which are targeted to inhibit PEX active site, identified in the method of the invention, are useful for the treatment of hyporphosphataemia or chronic renal failure. PEX can also be used as a target for the treatment of idiopathic

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

THE ADDITION: INVOLVED IN THE REGULATION OF CELL ADHESION AND IN MOINT CELL SISS-543 (2000).

- FERCATION: INVOLVED IN THE REGULATION OF CELL ADHESION AND IN THE CYTOSOLIC FORM BOUND TO AXIN ALLOWS THE STIMULATION OF TS. SUBJECT OF THE CYTOSOLIC FORM BOUND TO AXIN ALLOWS THE STIMULATION OF THE CYTOSOLIC FORM HOUSE OF THE STIMULATION OF THE CYTOSOLIC FORM HOUSE OF THE ALSO BIND CONTINES AND DUPLIN. CAN HETERODIMERIZE WITH ALPHA-CATENIN AND CONTINES AND DUPLIN. CAN HETERODIMERIZE WITH ALCHA-CATENIN AND CONTINES AT THE ANCHORAGE OF THE CADHERIN COMPLEX WITH CADHERIN. MEDIATES THE ANCHORAGE OF THE CADHERIN COMPLEX WITH CADHERIN. MEDIATES THE ANCHORAGE OF THE CADHERIN CAPOSPHORYLATION).

- SUBJECTION OF THE CADHERIN COMPLEX WITH CADHERIN. MEDIATES THE ANCHORAGE OF STABILIZED (LOW LEVEL OF PHOSPHORYLATION).

- STABILIZED (LOW LEVEL OF PHOSPHORYLATION) OF SETA-CATENIN IS REDUCED AND THE PROTEIN IS NO LONGER DEGRADED, CONTINING IN THE ACCUMULATION IN CYTOPLASM.

- RESULTING IN ITS ACCUMULATION IN CYTOPLASM.

- STAILLARITY: BELONGS TO THE BETA-CATENIN FAMILY.

 J. Cell. Physiol. 181:258-272(1999).

-! FUNCTION: INVOLVED IN THE REGULATION OF CELL ADHESION AND IN SIGNAL TRANSDUCTION THROUGH THE WWY PATHWAY (BY SIMILARITY).

-! SUBUNIT: THE CYTOSOLIC FORM BOUND TO AXIN ALLOWS THE STIMULATION OF ITS DEGRADATION. THE CYTOSOLIC FORM ALSO INTERACTS WITH APC AND E-CADHERIN. THE MUCLEAR FORM BINDS TCF/LEF-1 AND MAY ALSO BIND PONTINS2 AND DUPLIN. CAN HETERODIMERIZE WITH ALPHA-CATENIN AND ALSO FORM A TRIMERIC COMPLEX WITH CADHERIN. MEDIATES THE ANCHORAGE OF THE CADHERIN COMPLEX TO THE CORTICAL ACTIN CYTOSKELETON (BY
